Investment commentary

July was dominated by concerns over valuations in the artificial intelligence sector, leading to a sharp correction in semiconductor stocks. These concerns mainly relate to the risk of overcapacity in computing infrastructure and companies' ability to monetise these substantial investments. Meanwhile, renewed tensions between the US and Iran sent crude oil prices higher and put upward pressure on interest rates.

On the macroeconomic front, the European and US economies remained resilient despite the initial shock from soaring energy prices and continuing geopolitical tensions in the Middle East, recording robust growth in the second quarter. However, preliminary eurozone inflation estimates for July point to an acceleration, directly reflecting higher energy prices.

Central banks broadly kept policy unchanged during the month. As expected, the Bank of Japan kept its policy rates unchanged, while its monetary policy report highlighted the risk of inflation overshooting the 2% target amid sustained wage growth and rising inflation expectations. The Fed also left policy unchanged, with its new Chair, Kevin Warsh, maintaining his minimalist communication approach, consistent with his intention to make less use of 'forward guidance'. Finally, the ECB kept its policy rates unchanged, with the deposit facility rate at 2.25%, at an interim meeting ahead of the summer break, while revising its assessment of the risks posed by renewed tensions in the Middle East and their impact on energy supplies. The ECB therefore moved away from the balanced tone adopted in Sintra in early July and signalled greater vigilance regarding inflationary pressures.

Against this backdrop, the HY market delivered negative returns across all segments, falling by 0.27% overall: BB (-0.32%), B (-0.30%) and CCC (-0.98%), with the latter once again weighed down by restructuring situations involving Altice International, Antolin and Garfunkel. The Crossover index significantly underperformed cash during the month, returning -0.58%, but maintained its year-to-date outperformance, with a return of +2.50% and a performance advantage over cash of more than 85 basis points.

The telecommunications (-1.2%) and media (-0.46%) sectors were hurt by the fall in AI-related stocks and the sell-off in companies within the Liberty Media group. By contrast, energy and services were among the few sectors to deliver a positive return (+0.12%).

Primary-market activity was in line with historical averages, with €7 billion of new issuance, mainly to fund conventional refinancing. In terms of flows, the European HY market recorded its third consecutive month of inflows, attracting \$3.5 billion. Year to date, the market has recorded net inflows of \$1.8 billion.

The fundamentals of the HY market remain solid, with no signs of contagion from special situations and no expected increase in default rates. Technical factors continue to support the market, underpinned by robust inflows and the continued narrowing of the BB/B spread. Lastly, despite spreads remaining close to their historical lows, the absolute yield is still above 5%, preserving the market's appeal. Accordingly, the portfolio has a beta above 100 and remains fully invested, offering a slightly higher yield than the market and maintaining an overweight position in the B-rated segment.

Glossary

ALPHA	Alpha is equal to the average return on the product, i.e. the value added by the manager after deducting market influences over which the manager has no control. This calculation is expressed as a percentage.	BETA	Beta is an indicator of a fund's sensitivity relative to its benchmark. A fund with a beta of less than 1 is likely to fall less than its benchmark, while a fund with a beta of greater than 1 is likely to fall further than its benchmark.	RECOVERY PERIOD	The recovery period (expressed in days) is the number of days needed to recoup the losses incurred after a maximum loss is sustained. Maximum loss is the largest loss the fund has experienced.
AVERAGE SPREAD	A fund's average spread is the average yield spread between the bonds held by the fund and a benchmark (often government bonds). It reflects the amount of risk taken by the fund relative to securities considered risk-free.	SRI	The SRI (Synthetic Risk Indicator) provides an assessment of the product's risk relative to that of other products. It indicates the probability of the product incurring losses in the event of market movements or of us not being able to pay you. The risk indicator assumes that you will hold the product for the minimum recommended investment period.	SRRI	The SRRI (Synthetic Risk & Reward Indicator: Risk indicator based on the volatility over a period of 260 weeks). Historic data such as those used to calculate the synthetic indicator may not be a reliable indication of the future risk profile. The risk category associated with this Fund is not guaranteed and may change over time. The lowest category does not mean «riskfree».
AVERAGE RATING	A fund's average rating is the weighted average credit rating of the bonds that make up the fund's portfolio. It reflects the fund's overall credit quality: the higher the rating, the lower the risk of default.	INFORMATION RATIO	The information ratio is an indicator of the extent to which a fund has underperformed or outperformed its benchmark. A positive information ratio indicates outperformance. The higher the information ratio, the better the fund. The information ratio indicates the extent to which a fund has outperformed an index, taking into account the risk incurred.	SHARPE RATIO	The Sharpe ratio measures the difference between the return on a portfolio and the risk-free rate of return (i.e. the risk premium), divided by the standard deviation of the return on that portfolio (volatility). A high Sharpe ratio is considered good.
CREDIT SENSITIVITY	A fund's credit sensitivity is a measure of how much the fund's value changes as the credit spreads of the bonds held by the fund change. It indicates the fund's exposure to the risk of a deterioration in issuer credit quality.	MODIFIED DURATION	Modified duration is a measure of how far the price of a bond or the net asset value of a bond UCITS rises or falls in response to a 1% fluctuation in market interest rates.	SFDR	The SFDR (Sustainable Finance Disclosure Regulation) is a regulation intended to promote sustainability in the European financial sector. In particular, it proposes a typology to better identify assets falling under the banner of sustainable finance, notably through three categories: Article 6, Article 8 and Article 9 funds.
DURATION	A bond's duration is the time it takes to receive the discounted average present value of all associated cash flows (principal and interest), expressed in years.	SIX FINANCIAL STAR RATING	The rating is based on the analysis of the return and risk of each fund within its Europe performance category, using a minimum three-year track record. A score is calculated by comparing the fund's performance and volatility with those of its category index, and then converted into a number of stars according to a quintile ranking. A "junior" rating is applied to funds with a two- to three-year history, by linking their performance to their category index to reach the required three years. Categories or funds that are too heterogeneous, insufficiently documented, or with incomplete data are excluded from the process.	MAXIMUM DRAWDOWN	The maximum drawdown is the return over the worst possible investment period. It indicates the maximum loss an investor could have sustained if they had invested in the fund at the peak of the observation period and liquidated their investment at the lowest point in that period.
TRACKING ERROR	Tracking error is a measure of the risk taken by a fund relative to its benchmark. It is given by the annualised standard deviation of a fund's performance relative to its benchmark. The lower the tracking error, the closer the fund's risk profile is to that of its benchmark.	VOLATILITY	Volatility denotes the annualised standard deviation of returns in a historical series (fund/index). It quantifies a fund's risk by indicating how dispersed around the average the fund's returns are. The volatility of a money market fund is typically less than 1%. It is around 0.4% (or 40 basis points of volatility) for such funds. However, the volatility of an equity fund, which is invested in a riskier asset class, is often greater than 10%.
