▶ Investment commentary

The European high-yield market gained 1.92% in April, its best monthly performance since December 2023. Above all, the market recouped the bulk of its March losses and is already back in positive year-to-date territory. As military tensions in Iran eased despite the closure of the Strait of Hormuz, credit spreads narrowed 65 bps in the month, falling back below 300 bps. As regards interest rates, despite high volatility fuelled in particular by energy price movements, yields ended the month broadly stable, with the Bund yield ending the month at 3.04%, still 40 bps above its end-February level. While the European and US central banks left monetary policy unchanged at their end-April meetings, inflationary pressures stemming from the conflict could increase pressure on policymakers to adjust their stance at forthcoming meetings.

Monthly performance by rating highlighted the risk-on environment, dominated by the search for yield, with single-Bs (up 2.3%) and CCCs (up 3.7%) significantly outperforming BBs (up 1.6%). Hybrids also underperformed in the month (up 1.5%), penalised by persistently high interest rates, unattractive spread differentials relative to senior bonds for some issuers, and heavy primary issuance across the asset class. As regards individual issuers, chemicals firm Ineos Styrolution was the month's top outperformer (its 2030 issue gained 19%) amid improving margins and rising utilisation rates, despite a still aggressive capital structure. Among the biggest monthly declines were Air Baltic bonds, with the airline on the verge of a liquidity crisis and the current rise in kerosene prices only adding to its ongoing difficulties.

The fund slightly outperformed its benchmark in the month. On the macro front, the fund benefited in particular from its overexposure to credit via the iTraxx, which was trimmed during the month as credit spreads tightened sharply. It also benefited – albeit to a lesser extent – from effective management of its duration overweight. On the micro front, the fund benefited from rallies in property firm SBB and telecoms operator SFR following a fresh bid from the Bouygues-Free-Orange consortium. Conversely, the fund was penalised by its lack of exposure to chemicals firms Ineos and Styrolution.

The primary market had an extremely busy month in April, with issues totalling over €17 billion, the fifth-highest monthly total in the history of the European high-yield market, far exceeding the low issue volumes of February and March. The market benefited as credit spreads tightened, investors returned to the asset class and many issuers refinanced their debt. The main transactions included refinancing issues by names firmly anchored in the BB category – FiberCop (€1.5bn), Lottomatica (€765m), IHO (€600m), Mundys (€500m), New Immo (€500m) and Webuild (€400m) – as well as plenty of B-rated issuers, such as Kiloutou (€800m), Clariane (€730m) and United (€630m). Of particular note, however, was the emergence of a number of new issuers: TDC Brands (€550m), Egis (€450m), Fertiberia (€300m) and returning issuer Golden Goose (€700m). Lastly, the market easily absorbed all new issues.

In terms of flows, very strong outflows linked to the conflict in Iran (with outflows from the European high-yield market totalling \$16 billion between end February and mid-April) eased over the course of the month as investor began to pick up again; in the end, outflows totalled \$3.1 billion in April. This brings year-to-date net outflows to \$8.4 billion. Investor demand recovered more strongly in the US high-yield market, which ended April with net inflows of \$5 billion and is now broadly flat on a year-to-date basis.

Glossary

ALPHA	Alpha is equal to the average return on the product, i.e. the value added by the manager after deducting market influences over which the manager has no control. This calculation is expressed as a percentage.	BETA	Beta is an indicator of a fund's sensitivity relative to its benchmark. A fund with a beta of less than 1 is likely to fall less than its benchmark, while a fund with a beta of greater than 1 is likely to fall further than its benchmark.	RECOVERY PERIOD	The recovery period (expressed in days) is the number of days needed to recoup the losses incurred after a maximum loss is sustained. Maximum loss is the largest loss the fund has experienced.
AVERAGE SPREAD	A fund's average spread is the average yield spread between the bonds held by the fund and a benchmark (often government bonds). It reflects the amount of risk taken by the fund relative to securities considered risk-free.	SRI	The SRI (Synthetic Risk Indicator) provides an assessment of the product's risk relative to that of other products. It indicates the probability of the product incurring losses in the event of market movements or of us not being able to pay you. The risk indicator assumes that you will hold the product for the minimum recommended investment period.	SRR	The SRR (Synthetic Risk & Reward Indicator: Risk indicator based on the volatility over a period of 260 weeks). Historic data such as those used to calculate the synthetic indicator may not be a reliable indication of the future risk profile. The risk category associated with this Fund is not guaranteed and may change over time. The lowest category does not mean «riskfree».
AVERAGE RATING	A fund's average rating is the weighted average credit rating of the bonds that make up the fund's portfolio. It reflects the fund's overall credit quality: the higher the rating, the lower the risk of default.	INFORMATION RATIO	The information ratio is an indicator of the extent to which a fund has underperformed or outperformed its benchmark. A positive information ratio indicates outperformance. The higher the information ratio, the better the fund. The information ratio indicates the extent to which a fund has outperformed an index, taking into account the risk incurred.	SHARPE RATIO	The Sharpe ratio measures the difference between the return on a portfolio and the risk-free rate of return (i.e. the risk premium), divided by the standard deviation of the return on that portfolio (volatility). A high Sharpe ratio is considered good.
CREDIT SENSITIVITY	A fund's credit sensitivity is a measure of how much the fund's value changes as the credit spreads of the bonds held by the fund change. It indicates the fund's exposure to the risk of a deterioration in issuer credit quality.	MODIFIED DURATION	Modified duration is a measure of how far the price of a bond or the net asset value of a bond UCITS rises or falls in response to a 1% fluctuation in market interest rates.	SFDR	The SFDR (Sustainable Finance Disclosure Regulation) is a regulation intended to promote sustainability in the European financial sector. In particular, it proposes a typology to better identify assets falling under the banner of sustainable finance, notably through three categories: Article 6, Article 8 and Article 9 funds.
DURATION	A bond's duration is the time it takes to receive the discounted average present value of all associated cash flows (principal and interest), expressed in years.	SIX FINANCIAL STAR RATING	The rating is based on the analysis of the return and risk of each fund within its Europerformance category, using a minimum three-year track record. A score is calculated by comparing the fund's performance and volatility with those of its category index, and then converted into a number of stars according to a quintile ranking. A "junior" rating is applied to funds with a two- to three-year history, by linking their performance to their category index to reach the required three years. Categories or funds that are too heterogeneous, insufficiently documented, or with incomplete data are excluded from the process.	MAXIMUM DRAWDOWN	The maximum drawdown is the return over the worst possible investment period. It indicates the maximum loss an investor could have sustained if they had invested in the fund at the peak of the observation period and liquidated their investment at the lowest point in that period.
TRACKING ERROR	Tracking error is a measure of the risk taken by a fund relative to its benchmark. It is given by the annualised standard deviation of a fund's performance relative to its benchmark. The lower the tracking error, the closer the fund's risk profile is to that of its benchmark.	VOLATILITY	Volatility denotes the annualised standard deviation of returns in a historical series (fund/index). It quantifies a fund's risk by indicating how dispersed around the average the fund's returns are. The volatility of a money market fund is typically less than 1%. It is around 0.4% (or 40 basis points of volatility) for such funds. However, the volatility of an equity fund, which is invested in a riskier asset class, is often greater than 10%.
