Investment strategy

The fund aims to gain synthetic exposure to the Basket Precious Metals Strategy index, which represents a basket of precious metals and interest rate products, to seize opportunities offered by price fluctuations without investing directly in mining stocks in the sector. Its offering is simple and transparent, with currency risk hedged daily.

Investment commentary

The OFI Invest Precious Metals fund ended the month significantly higher, up more than 12%. All metals progressed, with silver gaining nearly 16%, platinum and palladium over 11% and gold more than 10%. This means gold is now flat year to date.

The Fed's decision at the end of July not to hike rates, together with figures showing falling inflation and a less dynamic job market, prompted investors to downgrade their expectations of monetary tightening in the US.

As a result, gold and precious metals, which are zero-yield assets, regained some investor appeal. August thus saw the strongest inflows into gold ETFs since mid-October 2025, when gold prices began to rise more quickly.

Nor did central banks stand idly by: they bought 289 tonnes of gold, up 62% year on year and the largest amount of second-quarter purchases since records began. China led the way, further ramping up its purchases and buying 20 tonnes in July, its twenty-second consecutive month of purchases.

Gold and silver also moved back into investors' good books in an environment where rising debt levels in major economies, geopolitical instability and the fragmentation of global trade are fuelling concerns. Question marks over the sustainability of major economies' debt are pushing long rates upwards for the wrong reasons (i.e. not because of any improvement in the growth outlook). In such an environment, demand for safe-haven assets increases.

Towards the end of the month, however, Fed Chair Kevin Warsh's speech at the Jackson Hole symposium put the brakes on this positive trend. Warsh reaffirmed the Fed's deep commitment to price stability and indicated that if inflation did not come down far enough by the time of its next meeting, the Fed would have work to do. The message was received loud and clear by the market, which immediately upgraded its expectations of US rate hikes. This weighed on gold and silver prices as well as commodities more generally.

Platinum group metals were also buoyed by this movement. But what probably convinced investors of the potential upside offered by these metals was confirmation of China's growing interest in them. While Beijing's latest five-year plan identifies platinum and palladium as strategic metals, its customs figures reveal that, over the first seven months of the year, China more than doubled its purchases of palladium from Russia and nearly quadrupled its purchases of platinum compared with the same period last year.

Kevin Warsh's comments at the end of the month, allowing doubts to persist as to the potential for a rate hike at the Fed's next meeting, could increase volatility and prompt some profit-taking on precious metals in the very short term. It seems, however, that even if there is a rate hike, it is unlikely to signal the start of a more far-reaching tightening cycle. Once the decision has been announced in mid-September (the Fed meeting is due to take place on 15 and 16 September), the issues of debt, de-dollarisation and the fragmentation of international trade are likely to once again dominate investor concerns and provide lasting support for precious metals prices.

Glossary

ALPHA	Alpha is equal to the average return on the product, i.e. the value added by the manager after deducting market influences over which the manager has no control. This calculation is expressed as a percentage.	BETA	Beta is an indicator of a fund's sensitivity relative to its benchmark. A fund with a beta of less than 1 is likely to fall less than its benchmark, while a fund with a beta of greater than 1 is likely to fall further than its benchmark.	RECOVERY PERIOD	The recovery period (expressed in days) is the number of days needed to recoup the losses incurred after a maximum loss is sustained. Maximum loss is the largest loss the fund has experienced.
SRRI	The SRRI (Synthetic Risk & Reward Indicator: Risk indicator based on the volatility over a period of 260 weeks). Historic data such as those used to calculate the synthetic indicator may not be a reliable indication of the future risk profile. The risk category associated with this Fund is not guaranteed and may change over time. The lowest category does not mean «riskfree».	TRACKING ERROR	Tracking error is a measure of the risk taken by a fund relative to its benchmark. It is given by the annualised standard deviation of a fund's performance relative to its benchmark. The lower the tracking error, the closer the fund's risk profile is to that of its benchmark.	VOLATILITY	Volatility denotes the annualised standard deviation of returns in a historical series (fund/index). It quantifies a fund's risk by indicating how dispersed around the average the fund's returns are. The volatility of a money market fund is typically less than 1%. It is around 0.4% (or 40 basis points of volatility) for such funds. However, the volatility of an equity fund, which is invested in a riskier asset class, is often greater than 10%.
SHARPE RATIO	The Sharpe ratio measures the difference between the return on a portfolio and the risk-free rate of return (i.e. the risk premium), divided by the standard deviation of the return on that portfolio (volatility). A high Sharpe ratio is considered good.	SFDR	The SFDR (Sustainable Finance Disclosure Regulation) is a regulation intended to promote sustainability in the European financial sector. In particular, it proposes a typology to better identify assets falling under the banner of sustainable finance, notably through three categories: Article 6, Article 8 and Article 9 funds.	SRI	The SRI (Synthetic Risk Indicator) provides an assessment of the product's risk relative to that of other products. It indicates the probability of the product incurring losses in the event of market movements or of us not being able to pay you. The risk indicator assumes that you will hold the product for the minimum recommended investment period.
SIX FINANCIAL STAR RATING	The rating is based on the analysis of the return and risk of each fund within its Europe performance category, using a minimum three-year track record. A score is calculated by comparing the fund's performance and volatility with those of its category index, and then converted into a number of stars according to a quintile ranking. A "junior" rating is applied to funds with a two- to three-year history, by linking their performance to their category index to reach the required three years. Categories or funds that are too heterogeneous, insufficiently documented, or with incomplete data are excluded from the process.	MAXIMUM DRAWDOWN	The maximum drawdown is the return over the worst possible investment period. It indicates the maximum loss an investor could have sustained if they had invested in the fund at the peak of the observation period and liquidated their investment at the lowest point in that period.	INFORMATION RATIO	The information ratio is an indicator of the extent to which a fund has underperformed or outperformed its benchmark. A positive information ratio indicates outperformance. The higher the information ratio, the better the fund. The information ratio indicates the extent to which a fund has outperformed an index, taking into account the risk incurred.
