▶ Investment commentary

Within the cavernous assembly halls of the Takasago plant, the overhead cranes of Mitsubishi Heavy Industries have not performed such a ballet in decades. This month, the conglomerate passed a symbolic milestone by shipping a new batch of its massive, state-of-the-art gas turbines—destined not for traditional factories, but to power the electricity-devouring behemoths that North American data centers have become. The old titan of Japanese heavy industry has transformed, almost unwittingly, into an indispensable supplier for the global artificial intelligence gold rush. This frenzy has propelled order books to dizzying heights this February. Faced with the insatiable urgency of American power demand, management has upgraded its annual operating profit forecast, now targeting the 350-billion-yen threshold. This unexpected renaissance illustrates the new grammar of Japanese capitalism in the face of the global tech shock. While attention has so far focused on the semiconductor fabs sprouting up across the country, markets are suddenly realizing that no generative algorithm can run without absolutely foolproof power generation and cooling infrastructure. Mitsubishi Heavy embodies this resounding revenge of hardware over pure software, finally reaping the rewards of a decade of painful streamlining to position its thermal engineering at the very core of the digital reactor. These dizzying heights now impose a ruthless standard of execution on the current backlog. Observers' attention will henceforth be fixated on the actual capacity of the archipelago's subcontracting network to keep pace with this brutal acceleration without choking their own supply chains.

Glossary

ALPHA
Alpha is equal to the average return on the product, i.e. the value added by the manager after deducting market influences over which the manager has no control. This calculation is expressed as a percentage.

BETA
Beta is an indicator of a fund's sensitivity relative to its benchmark. A fund with a beta of less than 1 is likely to fall less than its benchmark, while a fund with a beta of greater than 1 is likely to fall further than its benchmark.

RECOVERY PERIOD
The recovery period (expressed in days) is the number of days needed to recoup the losses incurred after a maximum loss is sustained. Maximum loss is the largest loss the fund has experienced.

SRR
The SRR (Synthetic Risk & Reward Indicator: Risk indicator based on the volatility over a period of 260 weeks). Historic data such as those used to calculate the synthetic indicator may not be a reliable indication of the future risk profile. The risk category associated with this Fund is not guaranteed and may change over time. The lowest category does not mean «riskfree».

TRACKING ERROR
Tracking error is a measure of the risk taken by a fund relative to its benchmark. It is given by the annualised standard deviation of a fund's performance relative to its benchmark. The lower the tracking error, the closer the fund's risk profile is to that of its benchmark.

VOLATILITY
Volatility denotes the annualised standard deviation of returns in a historical series (fund/index). It quantifies a fund's risk by indicating how dispersed around the average the fund's returns are. The volatility of a money market fund is typically less than 1%. It is around 0.4% (or 40 basis points of volatility) for such funds. However, the volatility of an equity fund, which is invested in a riskier asset class, is often greater than 10%.

SHARPE RATIO
The Sharpe ratio measures the difference between the return on a portfolio and the risk-free rate of return (i.e. the risk premium), divided by the standard deviation of the return on that portfolio (volatility). A high Sharpe ratio is considered good.

SFDR
The SFDR (Sustainable Finance Disclosure Regulation) is a regulation intended to promote sustainability in the European financial sector. In particular, it proposes a typology to better identify assets falling under the banner of sustainable finance, notably through three categories: Article 6, Article 8 and Article 9 funds.

SRI
The SRI (Synthetic Risk Indicator) provides an assessment of the product's risk relative to that of other products. It indicates the probability of the product incurring losses in the event of market movements or of us not being able to pay you. The risk indicator assumes that you will hold the product for the minimum recommended investment period.

SIX FINANCIAL STAR RATING
The rating is based on the analysis of the return and risk of each fund within its Europe performance category, using a minimum three-year track record. A score is calculated by comparing the fund's performance and volatility with those of its category index, and then converted into a number of stars according to a quintile ranking. A "junior" rating is applied to funds with a two- to three-year history, by linking their performance to their category index to reach the required three years. Categories or funds that are too heterogeneous, insufficiently documented, or with incomplete data are excluded from the process.

MAXIMUM DRAWDOWN
The maximum drawdown is the return over the worst possible investment period. It indicates the maximum loss an investor could have sustained if they had invested in the fund at the peak of the observation period and liquidated their investment at the lowest point in that period.

INFORMATION RATIO
The information ratio is an indicator of the extent to which a fund has underperformed or outperformed its benchmark. A positive information ratio indicates outperformance. The higher the information ratio, the better the fund. The information ratio indicates the extent to which a fund has outperformed an index, taking into account the risk incurred.
