Emerging market equities

Investment strategy

The fund is a sub-fund of the Global Platform SICAV managed by Syncicap AM, which specialises in sustainable investing in emerging countries. It aims to invest in Asian emerging market equities (excluding China) to take advantage of the attractive investment opportunities on offer. To this end, the fund adopts a conviction-based approach to select reasonably priced growth stocks.

▶ Investment commentary

For emerging Asia excluding China, March 2026 was a month of extreme volatility triggered by the war in the Middle East. The resulting closure of the Strait of Hormuz significantly affected Asia as a result of its high reliance on hydrocarbons from the Persian Gulf. After a prolonged period of AI-related euphoria, markets corrected significantly. The energy shock triggered record daily falls in some markets, such as South Korea (which lost 12% on 4 March). The fund's benchmark lost 13% in EUR in the month, significantly underperforming global benchmarks such as the Euro Stoxx (down 8% in EUR). The fund lost 13.17% in EUR, in line with its benchmark.

The hardest hit market was South Korea (down 21.3% in EUR). Memory-related stocks such as Samsung and Hynix corrected sharply on recessionary fears and concerns over a potential downturn in capital investment by US cloud providers. In particular, Google's announcement of TurboQuant, a technology aimed at reducing memory intensity, rattled investors. Meanwhile, DDR5 and HBM prices remain high and demand is still strong. We gradually took some profits on Samsung but remain exposed to this booming sector.

Despite the panic, the Taiwanese market proved relatively resilient, buoyed by TSMC's vital role in the global AI ecosystem. We reduced our exposure to MediaTek following its sharp rise in the year to date. Other stocks connected with investment in the AI sector proved resilient to the energy shock triggered by the Iran war.

In the Indian market, we are keeping a close eye on our overweight positioning: we are aware that the surge in oil prices is deepening India's current account and fiscal deficits, putting pressure on both economic growth and the rupee. At this stage, we are maintaining our exposure to India's main private banks such as Axis Bank: setting aside valuation effects on cash portfolios, we believe that underlying growth in credit is quickening, asset quality is improving and valuations have reached attractive levels. We took advantage of this market downturn to increase our overweight in Indian markets, which are trading at attractive valuations.

In general, the sharp decline in March represents a good entry point into Asian markets excluding China. We have not seen any slowdown in investment demand in the AI sector. TSMC's order book is well stocked for the next few years and the company is struggling to meet the demand from all its customers. Meanwhile, Asian countries have begun to diversify their oil supplies, reducing the importance of the Strait of Hormuz. For example, South Korea has announced that it has secured its oil supplies for the whole of 2026. We remain positive on emerging markets in Asia ex-China for years to come.

Glossary

ALPHA	Alpha is equal to the average return on the product, i.e. the value added by the manager after deducting market influences over which the manager has no control. This calculation is expressed as a percentage.	BETA	Beta is an indicator of a fund's sensitivity relative to its benchmark. A fund with a beta of less than 1 is likely to fall less than its benchmark, while a fund with a beta of greater than 1 is likely to fall further than its benchmark.	RECOVERY PERIOD	The recovery period (expressed in days) is the number of days needed to recoup the losses incurred after a maximum loss is sustained. Maximum loss is the largest loss the fund has experienced.
SRRRI	The SRRRI (Synthetic Risk & Reward Indicator: Risk indicator based on the volatility over a period of 260 weeks). Historic data such as those used to calculate the synthetic indicator may not be a reliable indication of the future risk profile. The risk category associated with this Fund is not guaranteed and may change over time. The lowest category does not mean «riskfree».	TRACKING ERROR	Tracking error is a measure of the risk taken by a fund relative to its benchmark. It is given by the annualised standard deviation of a fund's performance relative to its benchmark. The lower the tracking error, the closer the fund's risk profile is to that of its benchmark.	VOLATILITY	Volatility denotes the annualised standard deviation of returns in a historical series (fund/index). It quantifies a fund's risk by indicating how dispersed around the average the fund's returns are. The volatility of a money market fund is typically less than 1%. It is around 0.4% (or 40 basis points of volatility) for such funds. However, the volatility of an equity fund, which is invested in a riskier asset class, is often greater than 10%.
SHARPE RATIO	The Sharpe ratio measures the difference between the return on a portfolio and the risk-free rate of return (i.e. the risk premium), divided by the standard deviation of the return on that portfolio (volatility). A high Sharpe ratio is considered good.	SFDR	The SFDR (Sustainable Finance Disclosure Regulation) is a regulation intended to promote sustainability in the European financial sector. In particular, it proposes a typology to better identify assets falling under the banner of sustainable finance, notably through three categories: Article 6, Article 8 and Article 9 funds.	SRI	The SRI (Synthetic Risk Indicator) provides an assessment of the product's risk relative to that of other products. It indicates the probability of the product incurring losses in the event of market movements or of us not being able to pay you. The risk indicator assumes that you will hold the product for the minimum recommended investment period.
SIX FINANCIAL STAR RATING	The rating is based on the analysis of the return and risk of each fund within its Europeperformance category, using a minimum three-year track record. A score is calculated by comparing the fund's performance and volatility with those of its category index, and then converted into a number of stars according to a quintile ranking. A "junior" rating is applied to funds with a two- to three-year history, by linking their performance to their category index to reach the required three years. Categories or funds that are too heterogeneous, insufficiently documented, or with incomplete data are excluded from the process.	MAXIMUM DRAWDOWN	The maximum drawdown is the return over the worst possible investment period. It indicates the maximum loss an investor could have sustained if they had invested in the fund at the peak of the observation period and liquidated their investment at the lowest point in that period.	INFORMATION RATIO	The information ratio is an indicator of the extent to which a fund has underperformed or outperformed its benchmark. A positive information ratio indicates outperformance. The higher the information ratio, the better the fund. The information ratio indicates the extent to which a fund has outperformed an index, taking into account the risk incurred.
