Investment strategy

The fund aims to achieve a short-term return in excess of compounded €STR + 5 bps. It is intended for institutional investors wishing to secure a higher return on their cash than the overnight rate, combining flexibility of use, minimal risk and a responsible approach. One of the sources of the fund's outperformance is lengthening the maturity of investments.

▶ Investment commentary

Risk assets continued to gain ground in May, buoyed by stronger than expected quarterly earnings from US companies and investment momentum linked to artificial intelligence (AI). After several months dominated by geopolitical tensions, investors bet on a gradual easing in the Middle East and the reopening of the Strait of Hormuz. This prospect triggered a decline in oil prices and dampened some of the inflationary concerns that had been mounting since the start of the war in Iran.

The main US indices ended May at new all-time highs, with the S&P 500 even posting nine consecutive weekly gains. In Europe, markets benefited from the fall in oil prices after geopolitical tensions eased.

However, volatility remained high, with the global macroeconomic environment under pressure from persistent inflation and the possibility that the Fed might adopt a less accommodative monetary policy stance. Against this backdrop, bond yields rose during the month before falling again. In Europe, yields ultimately moved lower, with investors relieved by the fall in oil prices, which tempered expectations of monetary tightening by the European Central Bank (ECB).

US yields rose in May, supported by expectations of higher inflation and interest rates amid a slowing economic environment. The war in the Middle East and the blockade of the Strait of Hormuz are fuelling inflation through higher oil prices while putting downward pressure on growth. US PCE inflation, as measured by the index tracking prices linked to household consumption, quickened further in April. The PCE index is the Fed's preferred measure of inflation. Against this backdrop, a number of the Fed's governors signalled their readiness to raise interest rates if inflation takes longer than expected to come down.

In Europe, yields fell. A series of economic indicators led investors to scale back their expectations for ECB rate hikes over the coming months. In particular, the eurozone Purchasing Managers' Index (PMI) for May came in below expectations, pointing to the sharpest decline in private sector activity in two and a half years. In addition, the French economy declined 0.1% in the first quarter. This was the first contraction in Europe's second-largest economy since the Covid period, once again signalling that the effects of the energy shock triggered by tensions in the Middle East are beginning to spread to the real economy.

The European credit market was supported by investor risk appetite, with investment grade (IG) debt – considered the safest category – generating a positive monthly return, though this was surpassed by the more speculative high-yield segment.

Three-month Euribor ended the month at 2.268% and €STR at 1.93%.

Glossary

ALPHA	Alpha is equal to the average return on the product, i.e. the value added by the manager after deducting market influences over which the manager has no control. This calculation is expressed as a percentage.	BETA	Beta is an indicator of a fund's sensitivity relative to its benchmark. A fund with a beta of less than 1 is likely to fall less than its benchmark, while a fund with a beta of greater than 1 is likely to fall further than its benchmark.	RECOVERY PERIOD	The recovery period (expressed in days) is the number of days needed to recoup the losses incurred after a maximum loss is sustained. Maximum loss is the largest loss the fund has experienced.
WAL	WAL (weighted average life) is a measure of the average term to maturity of all securities in the portfolio, weighted to reflect the relative weighting of each instrument, where the maturity of a floating-rate instrument is taken to be the maturity of the security in question.	WAM	WAM (weighted average maturity) is a measure of the average term to maturity of the securities in the portfolio, weighted to reflect the relative weighting of each instrument, where the maturity of a floating-rate instrument is taken to be not the maturity of the security but the time remaining until the next interest rate reset.	YIELD TO MATURITY	Yield to maturity is considered a long-term bond yield expressed as an annual rate. Yield to maturity is calculated based on the assumption that all coupons are reinvested at the same rate as the bond's current yield, taking into account the bond's current price, par value, coupon rate and remaining term to maturity.
SRRI	The SRRI (Synthetic Risk & Reward Indicator: Risk indicator based on the volatility over a period of 260 weeks). Historic data such as those used to calculate the synthetic indicator may not be a reliable indication of the future risk profile. The risk category associated with this Fund is not guaranteed and may change over time. The lowest category does not mean «riskfree».	TRACKING ERROR	Tracking error is a measure of the risk taken by a fund relative to its benchmark. It is given by the annualised standard deviation of a fund's performance relative to its benchmark. The lower the tracking error, the closer the fund's risk profile is to that of its benchmark.	VOLATILITY	Volatility denotes the annualised standard deviation of returns in a historical series (fund/index). It quantifies a fund's risk by indicating how dispersed around the average the fund's returns are. The volatility of a money market fund is typically less than 1%. It is around 0.4% (or 40 basis points of volatility) for such funds. However, the volatility of an equity fund, which is invested in a riskier asset class, is often greater than 10%.
SHARPE RATIO	The Sharpe ratio measures the difference between the return on a portfolio and the risk-free rate of return (i.e. the risk premium), divided by the standard deviation of the return on that portfolio (volatility). A high Sharpe ratio is considered good.	SFDR	The SFDR (Sustainable Finance Disclosure Regulation) is a regulation intended to promote sustainability in the European financial sector. In particular, it proposes a typology to better identify assets falling under the banner of sustainable finance, notably through three categories: Article 6, Article 8 and Article 9 funds.	SRI	The SRI (Synthetic Risk Indicator) provides an assessment of the product's risk relative to that of other products. It indicates the probability of the product incurring losses in the event of market movements or of us not being able to pay you. The risk indicator assumes that you will hold the product for the minimum recommended investment period.
SIX FINANCIAL STAR RATING	The rating is based on the analysis of the return and risk of each fund within its Europerformance category, using a minimum three-year track record. A score is calculated by comparing the fund's performance and volatility with those of its category index, and then converted into a number of stars according to a quintile ranking. A "junior" rating is applied to funds with a two- to three-year history, by linking their performance to their category index to reach the required three years. Categories or funds that are too heterogeneous, insufficiently documented, or with incomplete data are excluded from the process.	MAXIMUM DRAWDOWN	The maximum drawdown is the return over the worst possible investment period. It indicates the maximum loss an investor could have sustained if they had invested in the fund at the peak of the observation period and liquidated their investment at the lowest point in that period.	INFORMATION RATIO	The information ratio is an indicator of the extent to which a fund has underperformed or outperformed its benchmark. A positive information ratio indicates outperformance. The higher the information ratio, the better the fund. The information ratio indicates the extent to which a fund has outperformed an index, taking into account the risk incurred.
