## Investment commentary

While the US government shutdown meant there were no macroeconomic statistics in October, equity indices gained ground on the back of "deals" with the Trump administration and the Fed's rate cuts, with the central bank concerned about the labour market trend. The pharmaceutical sector bounced back sharply thanks to the deal with Pfizer (and subsequently other groups) on drug prices, but this boost was very short-lived. The market uptrend was sustained by a certain easing of tensions between the US and China and, above all, once again, by the ongoing race to invest in Al. Questions as to whether or not there was a bubble proliferated, with the consensus apparently convinced that there was not. European corporate earnings for the third quarter on the whole failed to provide relief (unlike US earnings), paving the way for erratic price movements and mostly downward earnings revisions.

As regards performance, the fund slightly underperformed its benchmark, mainly as a result of stock selection. There were no notable sector allocation effects over the period. The absence of Argenx and the fund's underweights in Iberdrola and EssilorLuxottica were negative for performance in the month. However, this was partially offset by the absence from the portfolio of Rheinmetall and Deutsche Telekom.

Monthly report Part I **Equities** 

Glossary

Alpha is equal to the average return on the product, i.e. the value added by the manager after deducting market influences over which the manager has no control. This calculation is expressed as a percentage.

Beta is an indicator of a fund's sensitivity relative to its benchmark. A fund with a beta of less than 1 is likely to fall less than its benchmark, while a fund with a beta of greater than 1 is likely to fall further than its benchmark.

The recovery period (expressed in days) is the number of days needed to recoup the losses incurred after a maximum loss is sustained. Maximum loss is the largest loss the fund has experienced.

The SFDR (Sustainable Finance Disclosure Regulation) is a regulation intended to promote sustainability in the European financial sector. In particular, it proposes a typology to better identify assets falling under the banner of sustainable finance, notably through three categories: Article 6, Article 8 and Article 9 funds.

The SRI (Synthetic Risk Indicator) provides an assessment of the product's risk relative to that of other products. It indicates the probability of the product incurring losses in the event of market movements or of us not being able to pay you. The risk indicator assumes that you will hold the product for the minimum recommended investment period.

The SRRI (Synthetic Risk & Reward Indicator: Risk indicator based on the volatility over a period of 260 weeks). Historic data such as those used to calculate the synthetic indicator may not be a reliable indication of the future risk profile. The risk category associated with this Fund is not guaranteed and may change over time. The lowest category does not mean

The maximum drawdown is the return over the worst possible investment period. It indicates the maximum loss an investor could have sustained if they had invested in the fund at the peak of the observation period and liquidated their investment at the lowest point in that period.

INFORMATION

The information ratio is an indicator of the extent to which a fund has underperformed or outperformed its benchmark. A positive information ratio indicates outperformance. The higher the information ratio, the better the fund. The information ratio indicates the extent to which a fund has outperformed an index, taking into account the risk incurred.

The Sharpe ratio measures the difference between the return on a portfolio and the risk-free rate of return (i.e. the risk premium), divided by the standard deviation of the return on that portfolio (volatility). A high Sharpe ratio is considered good.

Tracking error is a measure of the risk taken by a fund relative to its benchmark. It is given by the annualised standard deviation of a fund's performance relative to its benchmark. The lower the tracking error, the closer the fund's risk profile is to that of its benchmark.

Volatility denotes the annualised standard deviation of returns in a historical series (fund/index). It quantifies a fund's risk by indicating how dispersed around the average the fund's returns are.

The volatility of a money market fund is typically less than 1%. It is around 0.4% (or 40 basis points of volatility) for such funds. However, the volatility of an equity fund, which is invested in a riskier asset class, is often greater than 10%.
