### Asset management strategy

The OFI Invest Energy Strategic Metals fund lost 7% in April.

April was a particularly busy month for metals markets, which were thrown into disarray from the outset of the month by Donald Trump's "Liberation Day", when he announced the imposition of import tariffs on all US trading partners without exception

The market was quick to react: extreme uncertainty and fears of recession triggered high volatility and set risk asset prices tumbling. Industrial metals suffered as investors anticipated a slowdown in activity and a potential decline in their use. However, after correcting for a few days, metals began to bounce back, recouping much of their initial losses. This recovery is down to two factors.

Firstly, although markets are worried about tariffs, they also expect metals consumption to show a degree of resilience. China, which accounts for over 50% of global demand, seems determined to stand up to Trump in this trade war and could respond by implementing a plan to support its economy. This would be in addition to measures already announced by the Chinese government at the beginning of the year, as yet largely unimplemented, and could significantly dampen the impact of tariffs on China's consumption of metals. Meanwhile, the US accounts for a relatively small proportion of global demand (less than 7% of the total annual consumption of aluminium or copper, for example) and it would take a pronounced slowdown in US activity to have a significant impact. The market is not convinced about this latter aspect: will the US government stick to its guns and impose tariffs so high that its own economy would tip into recession, sending US equity indices into a prolonged slide and weakening its sovereign debt market?

The second explanation for the resilience of metals in the current environment is the situation in the physical market. which is particularly tight, notably when it comes to aluminium and copper. In the case of copper, this is partly down to the shift in production to the US (driven by the price differential arising from the potential for a targeted tariff on copper). Beyond this technical aspect, everything appears to point to strong final demand for metals, particularly in China. This is partly down to the stimulus plan agreed in February, which stimulates household consumption, boosting household appliances for example. On the other hand, far from weakening, demand associated with the energy transition continues to ramp up: capex spending on China's power grid was up 25% YoY in the first guarter of 2025, marking the start of a fifth consecutive year of increased investment in this field. As a result, Chinese inventories are now plummeting: copper inventories are down 55% compared with their level over the same period of 2024. Meanwhile, refining margins continue to slide deeper into negative territory, signalling fierce competition among refiners to secure supplies of copper concentrate and keep their operations going.

Against this backdrop, industrial metals nevertheless corrected, with aluminium, silver, platinum and palladium losing around 6% each and copper and zinc down 9.5% each, while nickel and lead, having already lost ground in the early part of the year, fared better (down 3.5% and 2.4% respectively). These performances reflect market fears of an economic slowdown, despite signs of genuine tightness in the physical market. Although prices are likely to remain volatile over the coming months, the structural trend driven by the energy transition is well and truly powering demand, while supply is struggling to hold up. The metals market should thus find support despite the likelihood of persistent tightness
