► Investment commentary

Artificial intelligence is gradually moving beyond data centres and into factories. In mid-July, FANUC and Fujitsu announced that they had begun discussions on a potential collaboration in physical AI, supported by Nvidia's technology. The aim is to connect Fujitsu's computing and data-processing capabilities with FANUC's robots, computer numerical controls and factory-automation technologies.

Physical AI refers to systems that can perceive their environment, interpret incoming information and act in the real world. In a factory, this could enable a robot to understand spoken instructions, adjust its movements to handle different components, autonomously organise a parts-kitting operation or optimise a task using data collected along the production line. FANUC had already introduced an open physical AI platform and is now testing several practical applications.

The initiative is part of a broader movement. FANUC, Fujitsu, Yaskawa Electric, Kawasaki Heavy Industries, Hitachi, Kubota and several other Japanese groups intend to join the Nvidia Cosmos Coalition, which is designed to develop AI models for robotics, digital twins and industrial automation. In parallel, Japan's national FRONTia project is expected to provide dedicated computing infrastructure for physical AI.

The significance of this development therefore extends beyond a single technology partnership. Japan already has global leaders in industrial robots, sensors, motors, machine tools and automation. The next challenge is to add a software and cognitive layer to this industrial base. This shift could extend automation to less repetitive tasks, help address labour shortages and strengthen the competitiveness of Japanese manufacturing sites. It also highlights an important feature of the Japanese equity market: artificial intelligence is no longer confined to semiconductors or digital services, but is gradually becoming a broad-based industrial theme.

Glossary

ALPHA	Alpha is equal to the average return on the product, i.e. the value added by the manager after deducting market influences over which the manager has no control. This calculation is expressed as a percentage.	BETA	Beta is an indicator of a fund's sensitivity relative to its benchmark. A fund with a beta of less than 1 is likely to fall less than its benchmark, while a fund with a beta of greater than 1 is likely to fall further than its benchmark.	RECOVERY PERIOD	The recovery period (expressed in days) is the number of days needed to recoup the losses incurred after a maximum loss is sustained. Maximum loss is the largest loss the fund has experienced.
SRRI	The SRRI (Synthetic Risk & Reward Indicator: Risk indicator based on the volatility over a period of 260 weeks). Historic data such as those used to calculate the synthetic indicator may not be a reliable indication of the future risk profile. The risk category associated with this Fund is not guaranteed and may change over time. The lowest category does not mean «riskfree».	TRACKING ERROR	Tracking error is a measure of the risk taken by a fund relative to its benchmark. It is given by the annualised standard deviation of a fund's performance relative to its benchmark. The lower the tracking error, the closer the fund's risk profile is to that of its benchmark.	VOLATILITY	Volatility denotes the annualised standard deviation of returns in a historical series (fund/index). It quantifies a fund's risk by indicating how dispersed around the average the fund's returns are. The volatility of a money market fund is typically less than 1%. It is around 0.4% (or 40 basis points of volatility) for such funds. However, the volatility of an equity fund, which is invested in a riskier asset class, is often greater than 10%.
SHARPE RATIO	The Sharpe ratio measures the difference between the return on a portfolio and the risk-free rate of return (i.e. the risk premium), divided by the standard deviation of the return on that portfolio (volatility). A high Sharpe ratio is considered good.	SFDR	The SFDR (Sustainable Finance Disclosure Regulation) is a regulation intended to promote sustainability in the European financial sector. In particular, it proposes a typology to better identify assets falling under the banner of sustainable finance, notably through three categories: Article 6, Article 8 and Article 9 funds.	SRI	The SRI (Synthetic Risk Indicator) provides an assessment of the product's risk relative to that of other products. It indicates the probability of the product incurring losses in the event of market movements or of us not being able to pay you. The risk indicator assumes that you will hold the product for the minimum recommended investment period.
SIX FINANCIAL STAR RATING	The rating is based on the analysis of the return and risk of each fund within its Europeperformance category, using a minimum three-year track record. A score is calculated by comparing the fund's performance and volatility with those of its category index, and then converted into a number of stars according to a quintile ranking. A "junior" rating is applied to funds with a two- to three-year history, by linking their performance to their category index to reach the required three years. Categories or funds that are too heterogeneous, insufficiently documented, or with incomplete data are excluded from the process.	MAXIMUM DRAWDOWN	The maximum drawdown is the return over the worst possible investment period. It indicates the maximum loss an investor could have sustained if they had invested in the fund at the peak of the observation period and liquidated their investment at the lowest point in that period.	INFORMATION RATIO	The information ratio is an indicator of the extent to which a fund has underperformed or outperformed its benchmark. A positive information ratio indicates outperformance. The higher the information ratio, the better the fund. The information ratio indicates the extent to which a fund has outperformed an index, taking into account the risk incurred.
