Investment commentary

Amid doubts over the valuations of AI-related firms, the European high-yield market gained 0.15%, with spreads widening 2 bps, bringing the spread compression so far this year to more than 72 bps. The Crossover continued to outperform cash, tightening by 10 bps. Performance by rating confirmed this trend, with BB-rated debt gaining 0.02%, B-rated debt 0.29% and CCC-rated debt 1.6%. The top-performing sectors were automotive (up 0.60%), retail (up 0.47%) and consumer discretionary (up 0.4%), while the poorest performers were leisure (down 0.50%), transport (down 0.31%) and energy (down 0.22%). In terms of idiosyncratic events, Edreams (leisure) was hit hard by a change in the frequency of recognition of subscriptions, while Gamhol (casinos) was affected by the UK budget announcement of a huge increase in remote gaming duty. Conversely, some distressed issuers reported stronger than expected Q3 2025 results, examples being Modulaire (prefabricated solutions), Antolin (automotive equipment) and Flora Food (margarine). Primary market issues in November totalled more than €10.5 billion, most of it for refinancing purposes. On the demand side, Europe saw modest net outflows of \$688 million in November, bringing year-to-date net inflows to around \$9.2 billion. In the US, investors also turned their backs on the asset class, with outflows of \$1.1 billion. This brings year-to-date net inflows into the US high-yield market to \$22.7 billion.

In the US, the publication of official data resumed after the longest shutdown in history, pointing to moderate growth with no signs of significant disruption. The Fed minutes thus revealed differences between members, though most were in favour of continued rate cuts. In Europe, the minutes of the last ECB meeting highlighted the fact that members would only consider a further rate cut in the event of a sharp and persistent deviation of inflation away from its target.

In terms of gross performance, the fund underperformed its benchmark by 8 bps, mainly due to the portfolio being hedged via the Crossover, which cost 9 bps of relative performance, as well as the fund's underweight in distressed issuers that rallied strongly, such as Modulaire, Foncia, Flora Food and Cerba. Some picks were positive for performance, notable examples being SBB and Aroundtown in real estate, as well as the fund's underweight in cyclical sectors, particularly chemicals, thanks to its lack of exposure to Ineos and Styrolution. With spreads historically tight, the portfolio's defensive positioning remained unchanged.

Glossary

ALPHA	Alpha is equal to the average return on the product, i.e. the value added by the manager after deducting market influences over which the manager has no control. This calculation is expressed as a percentage.	BETA	Beta is an indicator of a fund's sensitivity relative to its benchmark. A fund with a beta of less than 1 is likely to fall less than its benchmark, while a fund with a beta of greater than 1 is likely to fall further than its benchmark.	RECOVERY PERIOD	The recovery period (expressed in days) is the number of days needed to recoup the losses incurred after a maximum loss is sustained. Maximum loss is the largest loss the fund has experienced.
AVERAGE SPREAD	A fund's average spread is the average yield spread between the bonds held by the fund and a benchmark (often government bonds). It reflects the amount of risk taken by the fund relative to securities considered risk-free.	SRI	The SRI (Synthetic Risk Indicator) provides an assessment of the product's risk relative to that of other products. It indicates the probability of the product incurring losses in the event of market movements or of us not being able to pay you. The risk indicator assumes that you will hold the product for the minimum recommended investment period.	SRRI	The SRRI (Synthetic Risk & Reward Indicator: Risk indicator based on the volatility over a period of 260 weeks). Historic data such as those used to calculate the synthetic indicator may not be a reliable indication of the future risk profile. The risk category associated with this Fund is not guaranteed and may change over time. The lowest category does not mean «riskfree».
AVERAGE RATING	A fund's average rating is the weighted average credit rating of the bonds that make up the fund's portfolio. It reflects the fund's overall credit quality: the higher the rating, the lower the risk of default.	INFORMATION RATIO	The information ratio is an indicator of the extent to which a fund has underperformed or outperformed its benchmark. A positive information ratio indicates outperformance. The higher the information ratio, the better the fund. The information ratio indicates the extent to which a fund has outperformed an index, taking into account the risk incurred.	SHARPE RATIO	The Sharpe ratio measures the difference between the return on a portfolio and the risk-free rate of return (i.e. the risk premium), divided by the standard deviation of the return on that portfolio (volatility). A high Sharpe ratio is considered good.
CREDIT SENSITIVITY	A fund's credit sensitivity is a measure of how much the fund's value changes as the credit spreads of the bonds held by the fund change. It indicates the fund's exposure to the risk of a deterioration in issuer credit quality.	MODIFIED DURATION	Modified duration is a measure of how far the price of a bond or the net asset value of a bond UCITS rises or falls in response to a 1% fluctuation in market interest rates.	SFDR	The SFDR (Sustainable Finance Disclosure Regulation) is a regulation intended to promote sustainability in the European financial sector. In particular, it proposes a typology to better identify assets falling under the banner of sustainable finance, notably through three categories: Article 6, Article 8 and Article 9 funds.
DURATION	A bond's duration is the time it takes to receive the discounted average present value of all associated cash flows (principal and interest), expressed in years.	SIX FINANCIAL STAR RATING	The rating is based on the analysis of the return and risk of each fund within its Europe performance category, using a minimum three-year track record. A score is calculated by comparing the fund's performance and volatility with those of its category index, and then converted into a number of stars according to a quintile ranking. A "junior" rating is applied to funds with a two- to three-year history, by linking their performance to their category index to reach the required three years. Categories or funds that are too heterogeneous, insufficiently documented, or with incomplete data are excluded from the process.	MAXIMUM DRAWDOWN	The maximum drawdown is the return over the worst possible investment period. It indicates the maximum loss an investor could have sustained if they had invested in the fund at the peak of the observation period and liquidated their investment at the lowest point in that period.
TRACKING ERROR	Tracking error is a measure of the risk taken by a fund relative to its benchmark. It is given by the annualised standard deviation of a fund's performance relative to its benchmark. The lower the tracking error, the closer the fund's risk profile is to that of its benchmark.	VOLATILITY	Volatility denotes the annualised standard deviation of returns in a historical series (fund/index). It quantifies a fund's risk by indicating how dispersed around the average the fund's returns are. The volatility of a money market fund is typically less than 1%. It is around 0.4% (or 40 basis points of volatility) for such funds. However, the volatility of an equity fund, which is invested in a riskier asset class, is often greater than 10%.
