Investment strategy

The fund aims to take advantage of the upside offered by a selection of metals (aluminium, lead, gold, palladium, platinum, silver, nickel, zinc, copper) by gaining synthetic exposure to the Basket Energy Strategic Metals index without investing directly in mining stocks in the sector. Its offering is simple and transparent, with currency risk hedged daily.

Investment commentary

The OFI Invest Energy Strategic Metals fund continued to gain ground, posting its fourth consecutive monthly gain.

Precious metals were once again the biggest contributors to performance. Silver in particular continued to rise, gaining more than 17% in the month, while platinum gained nearly 7% and palladium just over 2%. The structural factors at play in these markets remain unchanged. The silver market is in deficit for the fifth consecutive year, while demand for platinum exceeds supply for the fourth year running. The movement of silver stockpiles to the US on fears of potential import taxes continued to fuel tensions in this market, with the amount of silver available in other major financial markets now very low. The addition of silver to the US list of critical metals last month only heightened concerns.

In copper, concerns over production persist. For the first time since 1980, gold, silver and copper have all set new price records in the same year. Constraints on the supply of copper were confirmed, with Freeport in particular confirming difficulties at the Grasberg mine following the mudslide that hit the site in September. Production is expected to gradually resume but will not be back to normal before 2027. This confirms fears that the copper market will go into deficit next year. As a reminder, the International Energy Agency expects demand to outstrip supply by 20% by 2030. In practice, this means prices will have to rise to close this gap.

Aluminium had a relatively quiet month, ending the period more or less flat (down 0.94%). The market remains tight in the short term, the question being whether this can last. While China is very close to the 45-million-tonne limit set by the authorities, Indonesia has said it can substantially increase production within a fairly short time frame. There are thus widely divergent views on the market equilibrium in 2026, and this is preventing investors from taking positions for the time being.

OFI Invest Energy Strategic Metals fund has so far had an excellent year. A legitimate question after such strong gains is whether the movement can be sustained over the next few months. Since the commodity market is a market where prices are based on the spot supply-demand balance, the emergence of a supply shortage necessarily pushes up prices until such time as either demand falls or supply increases. Such adjustments in metals are slow and difficult: opening a mine takes time, and managing without a metal is not easy. The fund therefore remains as relevant as ever as a diversification option, enabling investors to benefit from multiple trends that should continue to support metals over the coming months.

Glossary

ALPHA	Alpha is equal to the average return on the product, i.e. the value added by the manager after deducting market influences over which the manager has no control. This calculation is expressed as a percentage.	BETA	Beta is an indicator of a fund's sensitivity relative to its benchmark. A fund with a beta of less than 1 is likely to fall less than its benchmark, while a fund with a beta of greater than 1 is likely to fall further than its benchmark.	RECOVERY PERIOD	The recovery period (expressed in days) is the number of days needed to recoup the losses incurred after a maximum loss is sustained. Maximum loss is the largest loss the fund has experienced.
SRRI	The SRRI (Synthetic Risk & Reward Indicator: Risk indicator based on the volatility over a period of 260 weeks). Historic data such as those used to calculate the synthetic indicator may not be a reliable indication of the future risk profile. The risk category associated with this Fund is not guaranteed and may change over time. The lowest category does not mean «riskfree».	TRACKING ERROR	Tracking error is a measure of the risk taken by a fund relative to its benchmark. It is given by the annualised standard deviation of a fund's performance relative to its benchmark. The lower the tracking error, the closer the fund's risk profile is to that of its benchmark.	VOLATILITY	Volatility denotes the annualised standard deviation of returns in a historical series (fund/index). It quantifies a fund's risk by indicating how dispersed around the average the fund's returns are. The volatility of a money market fund is typically less than 1%. It is around 0.4% (or 40 basis points of volatility) for such funds. However, the volatility of an equity fund, which is invested in a riskier asset class, is often greater than 10%.
SHARPE RATIO	The Sharpe ratio measures the difference between the return on a portfolio and the risk-free rate of return (i.e. the risk premium), divided by the standard deviation of the return on that portfolio (volatility). A high Sharpe ratio is considered good.	SFDR	The SFDR (Sustainable Finance Disclosure Regulation) is a regulation intended to promote sustainability in the European financial sector. In particular, it proposes a typology to better identify assets falling under the banner of sustainable finance, notably through three categories: Article 6, Article 8 and Article 9 funds.	SRI	The SRI (Synthetic Risk Indicator) provides an assessment of the product's risk relative to that of other products. It indicates the probability of the product incurring losses in the event of market movements or of us not being able to pay you. The risk indicator assumes that you will hold the product for the minimum recommended investment period.
SIX FINANCIAL STAR RATING	The rating is based on the analysis of the return and risk of each fund within its Europeperformance category, using a minimum three-year track record. A score is calculated by comparing the fund's performance and volatility with those of its category index, and then converted into a number of stars according to a quintile ranking. A "junior" rating is applied to funds with a two- to three-year history, by linking their performance to their category index to reach the required three years. Categories or funds that are too heterogeneous, insufficiently documented, or with incomplete data are excluded from the process.	MAXIMUM DRAWDOWN	The maximum drawdown is the return over the worst possible investment period. It indicates the maximum loss an investor could have sustained if they had invested in the fund at the peak of the observation period and liquidated their investment at the lowest point in that period.	INFORMATION RATIO	The information ratio is an indicator of the extent to which a fund has underperformed or outperformed its benchmark. A positive information ratio indicates outperformance. The higher the information ratio, the better the fund. The information ratio indicates the extent to which a fund has outperformed an index, taking into account the risk incurred.
