Marketed in 

Six Financial Information star rating<sup>(1)(2)(3)</sup>  
Commodities

## Investment strategy

The fund aims to take advantage of the upside offered by a selection of metals (aluminium, lead, palladium, platinum, silver, nickel, zinc, copper) by gaining synthetic exposure to the Basket Energy Strategic Metals index without investing directly in mining stocks in the sector.

### ▶ Investment commentary

The fund gained 3.35% in April. Industrial metals continued to perform well despite the protracted conflict in the Middle East, the ongoing closure of the Strait of Hormuz and growing concerns over the potential impacts of this situation on economic activity. The market now seems to be focusing on production constraints stemming from the closure of the Strait of Hormuz. In addition to oil, the region supplies nearly a quarter of the world's sulphur, which is essential for refining certain metals. For example, it takes 10 tonnes of sulphuric acid to produce 1 tonne of nickel. Indonesia, the world's leading nickel producer, imports around 75% of its sulphur from the Middle East. Supply constraints on sulphur have been exacerbated in recent weeks by the decision by China and a number of other countries to restrict exports of this raw material. This situation could result in a sharp decline in the supply of nickel.

In addition, Indonesia has announced that it wants more control over its production. The country has invested heavily in nickel mining, growing its share of global production from 7% in 2015 to 64% in 2025. With supply outpacing demand in the short term, the government is keen to rebalance the market by lowering the limit on how much nickel each mining company is allowed to produce, restricting exports and setting a floor price for producers. Nickel was thus the top contributor to performance in April, gaining more than 13% over the period.

Copper and zinc are also affected by the availability of sulphuric acid, albeit to a lesser extent: around 15% of copper is refined by leaching, a process that requires sulphur. Specialists estimate that a lasting conflict could affect up to 5% of the annual supply of copper. This is in addition to the mounting production difficulties faced by mining companies: Ivanhoe Mines has notably cut its estimated production from the Kamoanga mine (DRC) by 90,000 tonnes in 2026 and 120,000 tonnes in 2027. Chile also reported a sharp drop in copper production in the early part of the year, which, if this weakness were to continue, would result in annual production of 4.7 million tonnes, compared with a market expectation of 5.2 million tonnes. Copper gained 5.5% in April and zinc nearly 4%.

Meanwhile, despite being the metal most affected by the war in the Middle East, aluminium gained very little in the month (up 0.3%). Yet the news on aluminium production is alarming: the Middle East refines around 9% of the world's aluminium, and the region's largest refinery, Al Taweelah, was hit by strikes, rendering it unusable. Experts estimate that, even if the Strait of Hormuz were to reopen soon, it would likely take 6 to 12 months for production to recover. The result is thus a considerable lasting reduction in supply in this market. The market nevertheless paused for breath in April after rising sharply in March; the accumulation of significant reserves of aluminium in China, as well as the potential impacts of the war on final demand, may have helped moderate the rise in prices.

Semi-precious metals were in wait-and-see mode, with platinum and palladium rising slightly, while silver lost almost 2% due to its correlation with gold, affected by rising interest rates.

The impact of the situation in the Middle East is complex: the market now seems to want to remain optimistic that the conflict will be swiftly resolved and the Strait of Hormuz reopened. However, if the Strait were to remain closed for a prolonged period, this could end up affecting activity through higher oil prices or restrictions on use. This scenario encourages a measured approach to risk. Conversely, sharp declines in metal production have a big positive impact on some markets, and a prolonged conflict would only amplify the supply shock. In the longer term, we believe this new energy shock paves the way for a faster energy transition, as already suggested by the surge in demand for electric vehicles and solar panels. That being the case, the promising trend in strategic metals could just be getting started.

Glossary

ALPHA	Alpha is equal to the average return on the product, i.e. the value added by the manager after deducting market influences over which the manager has no control. This calculation is expressed as a percentage.	BETA	Beta is an indicator of a fund's sensitivity relative to its benchmark. A fund with a beta of less than 1 is likely to fall less than its benchmark, while a fund with a beta of greater than 1 is likely to fall further than its benchmark.	RECOVERY PERIOD	The recovery period (expressed in days) is the number of days needed to recoup the losses incurred after a maximum loss is sustained. Maximum loss is the largest loss the fund has experienced.
SRRRI	The SRRRI (Synthetic Risk & Reward Indicator: Risk indicator based on the volatility over a period of 260 weeks). Historic data such as those used to calculate the synthetic indicator may not be a reliable indication of the future risk profile. The risk category associated with this Fund is not guaranteed and may change over time. The lowest category does not mean «riskfree».	TRACKING ERROR	Tracking error is a measure of the risk taken by a fund relative to its benchmark. It is given by the annualised standard deviation of a fund's performance relative to its benchmark. The lower the tracking error, the closer the fund's risk profile is to that of its benchmark.	VOLATILITY	Volatility denotes the annualised standard deviation of returns in a historical series (fund/index). It quantifies a fund's risk by indicating how dispersed around the average the fund's returns are. The volatility of a money market fund is typically less than 1%. It is around 0.4% (or 40 basis points of volatility) for such funds. However, the volatility of an equity fund, which is invested in a riskier asset class, is often greater than 10%.
SHARPE RATIO	The Sharpe ratio measures the difference between the return on a portfolio and the risk-free rate of return (i.e. the risk premium), divided by the standard deviation of the return on that portfolio (volatility). A high Sharpe ratio is considered good.	SFDR	The SFDR (Sustainable Finance Disclosure Regulation) is a regulation intended to promote sustainability in the European financial sector. In particular, it proposes a typology to better identify assets falling under the banner of sustainable finance, notably through three categories: Article 6, Article 8 and Article 9 funds.	SRI	The SRI (Synthetic Risk Indicator) provides an assessment of the product's risk relative to that of other products. It indicates the probability of the product incurring losses in the event of market movements or of us not being able to pay you. The risk indicator assumes that you will hold the product for the minimum recommended investment period.
SIX FINANCIAL STAR RATING	The rating is based on the analysis of the return and risk of each fund within its Europe performance category, using a minimum three-year track record. A score is calculated by comparing the fund's performance and volatility with those of its category index, and then converted into a number of stars according to a quintile ranking. A "junior" rating is applied to funds with a two- to three-year history, by linking their performance to their category index to reach the required three years. Categories or funds that are too heterogeneous, insufficiently documented, or with incomplete data are excluded from the process.	MAXIMUM DRAWDOWN	The maximum drawdown is the return over the worst possible investment period. It indicates the maximum loss an investor could have sustained if they had invested in the fund at the peak of the observation period and liquidated their investment at the lowest point in that period.	INFORMATION RATIO	The information ratio is an indicator of the extent to which a fund has underperformed or outperformed its benchmark. A positive information ratio indicates outperformance. The higher the information ratio, the better the fund. The information ratio indicates the extent to which a fund has outperformed an index, taking into account the risk incurred.
