Investment strategy

The fund aims to achieve a short-term return in excess of compounded €STR + 5 bps. It is intended for institutional investors wishing to secure a higher return on their cash than the overnight rate, combining flexibility of use, minimal risk and a responsible approach. One of the sources of the fund's outperformance is lengthening the maturity of investments.

Investment commentary

Overall, risk assets had a positive month in August, supported by reassuring economic indicators and robust corporate earnings, particularly in the tech sector, though the end of the month was more turbulent.

Meanwhile, the fixed income market had a much more challenging month. Tensions were fuelled by inflationary fears amid a lack of progress on Middle East peace and the reopening of the Strait of Hormuz.

US equity markets rose sharply in August thanks to reassuring economic indicators and strong corporate earnings, propelling the S&P 500 to record highs. European indices gained ground overall in August, following Wall Street higher, helped by strong corporate earnings releases and reassuring news on growth. Major European indices reached or approached all-time highs at the beginning of the month. The end of the month was more challenging, with the CAC 40 and several European markets losing ground as a result of geopolitical tensions and rising oil prices.

August was a turbulent month for bond markets, due in particular to uncertainty over fiscal and monetary policy trajectories, with fiscal imbalances in the US and Europe fuelling mounting investor concern.

On the central bank front, persistently high inflation, despite mainly being the result of the energy shock triggered by the war in Iran, put upward pressure on interest rates. Against this backdrop, yields rose and monetary policy tightening appeared increasingly likely following the Fed chair’s comments about inflation at Jackson Hole. During his speech, Kevin Warsh said he did not see current financing conditions as restrictive and that the latest US inflation numbers, which were better than expected, had not convinced him that the trend was improving.

The yield on two-year US Treasuries, which are particularly sensitive to Fed policy, rose 5 basis points in August to 4.34%. The yield on 10-year Treasuries rose 2 bps to 4.75%, its highest since January 2025 and close to its 2007 and 2023 highs.

The trajectory was clearer in Europe. The yield on the 10-year German Bund rose 12 bps over the period to 3.32%, its highest in 15 years. Meanwhile, the yield on 10-year French OATs rose 18 bps to 4.18%, returning to 2008 levels.

Three-month Euribor ended the month at 2.593% and €STR at 2.185%.

Glossary

ALPHA
Alpha is equal to the average return on the product, i.e. the value added by the manager after deducting market influences over which the manager has no control. This calculation is expressed as a percentage.

BETA
Beta is an indicator of a fund's sensitivity relative to its benchmark. A fund with a beta of less than 1 is likely to fall less than its benchmark, while a fund with a beta of greater than 1 is likely to fall further than its benchmark.

RECOVERY PERIOD
The recovery period (expressed in days) is the number of days needed to recoup the losses incurred after a maximum loss is sustained. Maximum loss is the largest loss the fund has experienced.

WAL
WAL (weighted average life) is a measure of the average term to maturity of all securities in the portfolio, weighted to reflect the relative weighting of each instrument, where the maturity of a floating-rate instrument is taken to be the maturity of the security in question.

WAM
WAM (weighted average maturity) is a measure of the average term to maturity of the securities in the portfolio, weighted to reflect the relative weighting of each instrument, where the maturity of a floating-rate instrument is taken to be not the maturity of the security but the time remaining until the next interest rate reset.

YIELD TO MATURITY
Yield to maturity is considered a long-term bond yield expressed as an annual rate. Yield to maturity is calculated based on the assumption that all coupons are reinvested at the same rate as the bond's current yield, taking into account the bond's current price, par value, coupon rate and remaining term to maturity.

SRRI
The SRRI (Synthetic Risk & Reward Indicator: Risk indicator based on the volatility over a period of 260 weeks). Historic data such as those used to calculate the synthetic indicator may not be a reliable indication of the future risk profile. The risk category associated with this Fund is not guaranteed and may change over time. The lowest category does not mean «riskfree».

TRACKING ERROR
Tracking error is a measure of the risk taken by a fund relative to its benchmark. It is given by the annualised standard deviation of a fund's performance relative to its benchmark. The lower the tracking error, the closer the fund's risk profile is to that of its benchmark.

VOLATILITY
Volatility denotes the annualised standard deviation of returns in a historical series (fund/index). It quantifies a fund's risk by indicating how dispersed around the average the fund's returns are.
The volatility of a money market fund is typically less than 1%. It is around 0.4% (or 40 basis points of volatility) for such funds. However, the volatility of an equity fund, which is invested in a riskier asset class, is often greater than 10%.

SHARPE RATIO
The Sharpe ratio measures the difference between the return on a portfolio and the risk-free rate of return (i.e. the risk premium), divided by the standard deviation of the return on that portfolio (volatility). A high Sharpe ratio is considered good.

SFDR
The SFDR (Sustainable Finance Disclosure Regulation) is a regulation intended to promote sustainability in the European financial sector. In particular, it proposes a typology to better identify assets falling under the banner of sustainable finance, notably through three categories: Article 6, Article 8 and Article 9 funds.

SRI
The SRI (Synthetic Risk Indicator) provides an assessment of the product's risk relative to that of other products. It indicates the probability of the product incurring losses in the event of market movements or of us not being able to pay you. The risk indicator assumes that you will hold the product for the minimum recommended investment period.

SIX FINANCIAL STAR RATING
The rating is based on the analysis of the return and risk of each fund within its Europerformance category, using a minimum three-year track record. A score is calculated by comparing the fund's performance and volatility with those of its category index, and then converted into a number of stars according to a quintile ranking. A "junior" rating is applied to funds with a two- to three-year history, by linking their performance to their category index to reach the required three years. Categories or funds that are too heterogeneous, insufficiently documented, or with incomplete data are excluded from the process.

MAXIMUM DRAWDOWN
The maximum drawdown is the return over the worst possible investment period. It indicates the maximum loss an investor could have sustained if they had invested in the fund at the peak of the observation period and liquidated their investment at the lowest point in that period.

INFORMATION RATIO
The information ratio is an indicator of the extent to which a fund has underperformed or outperformed its benchmark. A positive information ratio indicates outperformance. The higher the information ratio, the better the fund. The information ratio indicates the extent to which a fund has outperformed an index, taking into account the risk incurred.
