▶ Investment commentary

The oil shock triggered by the closure of the Strait of Hormuz has simultaneously increased both downside risks to growth and upward pressure on inflation. This stagflationary scenario makes it more complicated for central banks to react, forcing them to choose between anchoring inflation expectations and protecting financing conditions. This paradox heightened tensions on bond markets, with monetary policy expectations rapidly shifting and investors expecting up to four rate hikes. All points on sovereign yield curves were thus pushed upwards, with German, French and US 10-year yields ending the month at 3%, 3.8% and 4.3% respectively.

Against this backdrop, spreads in the European high-yield market widened 75 bps, with CCCs and single-Bs underperforming significantly (+275 bps and +90 bps respectively) and BBs outperforming (+47 bps). The market thus fell 2.71% (with BBs down 2.55%, single-Bs down 3.07% and CCCs down 3.2%), with the BB segment mainly impacted by the rise in sovereign yields. The Crossover (excluding changes in scope) widened 66 bps. The top-performing sectors in the month were energy (down 1.1%), consumer goods (down 1.48%) and technology (up 1.63%), while the poorest performers were transport (down 4.3%), real estate (down 4%) and capital goods (down 3.3%).

After a very good start to the month, the primary market was brought to an abrupt standstill by the conflict; new issues totalled €7.6 billion, including a €4 billion perpetual subordinated bond issued by Stellantis. In terms of flows, outflows were significant, totalling \$10 billion from the European high-yield market and \$6.2 billion from its US counterpart. This brings year-to-date net outflows to \$1.3 billion, and \$4.8 billion in the US.

The fund's positioning changed significantly over the course of the month in terms of its sensitivity to the credit and interest rate markets. Its beta is now above 1 and the portfolio is more rate-sensitive than its benchmark at the 2-year and 5-year points. This positioning explains the bulk of the fund's underperformance in March.

Glossary

ALPHA	Alpha is equal to the average return on the product, i.e. the value added by the manager after deducting market influences over which the manager has no control. This calculation is expressed as a percentage.	BETA	Beta is an indicator of a fund's sensitivity relative to its benchmark. A fund with a beta of less than 1 is likely to fall less than its benchmark, while a fund with a beta of greater than 1 is likely to fall further than its benchmark.	RECOVERY PERIOD	The recovery period (expressed in days) is the number of days needed to recoup the losses incurred after a maximum loss is sustained. Maximum loss is the largest loss the fund has experienced.
AVERAGE SPREAD	A fund's average spread is the average yield spread between the bonds held by the fund and a benchmark (often government bonds). It reflects the amount of risk taken by the fund relative to securities considered risk-free.	SRI	The SRI (Synthetic Risk Indicator) provides an assessment of the product's risk relative to that of other products. It indicates the probability of the product incurring losses in the event of market movements or of us not being able to pay you. The risk indicator assumes that you will hold the product for the minimum recommended investment period.	SRR	The SRR (Synthetic Risk & Reward Indicator: Risk indicator based on the volatility over a period of 260 weeks). Historic data such as those used to calculate the synthetic indicator may not be a reliable indication of the future risk profile. The risk category associated with this Fund is not guaranteed and may change over time. The lowest category does not mean «riskfree».
AVERAGE RATING	A fund's average rating is the weighted average credit rating of the bonds that make up the fund's portfolio. It reflects the fund's overall credit quality: the higher the rating, the lower the risk of default.	INFORMATION RATIO	The information ratio is an indicator of the extent to which a fund has underperformed or outperformed its benchmark. A positive information ratio indicates outperformance. The higher the information ratio, the better the fund. The information ratio indicates the extent to which a fund has outperformed an index, taking into account the risk incurred.	SHARPE RATIO	The Sharpe ratio measures the difference between the return on a portfolio and the risk-free rate of return (i.e. the risk premium), divided by the standard deviation of the return on that portfolio (volatility). A high Sharpe ratio is considered good.
CREDIT SENSITIVITY	A fund's credit sensitivity is a measure of how much the fund's value changes as the credit spreads of the bonds held by the fund change. It indicates the fund's exposure to the risk of a deterioration in issuer credit quality.	MODIFIED DURATION	Modified duration is a measure of how far the price of a bond or the net asset value of a bond UCITS rises or falls in response to a 1% fluctuation in market interest rates.	SFDR	The SFDR (Sustainable Finance Disclosure Regulation) is a regulation intended to promote sustainability in the European financial sector. In particular, it proposes a typology to better identify assets falling under the banner of sustainable finance, notably through three categories: Article 6, Article 8 and Article 9 funds.
DURATION	A bond's duration is the time it takes to receive the discounted average present value of all associated cash flows (principal and interest), expressed in years.	SIX FINANCIAL STAR RATING	The rating is based on the analysis of the return and risk of each fund within its Europerformance category, using a minimum three-year track record. A score is calculated by comparing the fund's performance and volatility with those of its category index, and then converted into a number of stars according to a quintile ranking. A "junior" rating is applied to funds with a two- to three-year history, by linking their performance to their category index to reach the required three years. Categories or funds that are too heterogeneous, insufficiently documented, or with incomplete data are excluded from the process.	MAXIMUM DRAWDOWN	The maximum drawdown is the return over the worst possible investment period. It indicates the maximum loss an investor could have sustained if they had invested in the fund at the peak of the observation period and liquidated their investment at the lowest point in that period.
TRACKING ERROR	Tracking error is a measure of the risk taken by a fund relative to its benchmark. It is given by the annualised standard deviation of a fund's performance relative to its benchmark. The lower the tracking error, the closer the fund's risk profile is to that of its benchmark.	VOLATILITY	Volatility denotes the annualised standard deviation of returns in a historical series (fund/index). It quantifies a fund's risk by indicating how dispersed around the average the fund's returns are. The volatility of a money market fund is typically less than 1%. It is around 0.4% (or 40 basis points of volatility) for such funds. However, the volatility of an equity fund, which is invested in a riskier asset class, is often greater than 10%.
